Professional Overview

Backend Engineer with experience developing large-scale digital banking solutions and business-critical backend services. Skilled in API development, distributed systems, production support, and cross-team feature delivery.

Technical Skills

Backend: Java, Micronaut, Spring Boot, REST APIs, Microservices, Event-Driven Architecture

Database & Messaging: Oracle DB, MySQL, SQL Server, Kafka, Redis

DevOps & Infrastructure: Docker, Kubernetes, Jenkins, ArgoCD, SonarQube, Kong, Istio

Tools: Git, Jira, Linux, Postman, Swagger

Work Experience

Software Engineer

Ejada

Alexandria, Egypt

Aug 2024 – Present

- Contributed to the development of Nera, a digital banking platform for Al Rajhi Bank, using Java, Micronaut, and microservices architecture.
- Developed and enhanced 50+ REST APIs supporting key banking features including payments, settlements, onboarding, and internal service integrations.
- Contributed across 20+ microservices within a large distributed banking ecosystem consisting of 100+ services.
- Worked extensively with Oracle DB for transactional operations, query development, and backend data integration.
- Managed asynchronous workflows using Kafka, caching with Redis, and database migrations using Flyway.
- Investigated and resolved numerous issues across SIT/UAT environments, collaborating with internal and third-party teams to validate fixes and improve release quality.
- Participated in weekly production deployment windows and release activities, ensuring smooth deployments and operational readiness.
- Performed Post-Implementation Verification (PIV) to validate production changes after deployments and ensure successful feature rollout.
- Provided on-site production and operational support for banking releases in Saudi Arabia.
- Collaborated closely with frontend engineers and backend teams to integrate services and deliver features within tight timelines.
- Implemented unit tests using Mockito to achieve 100% test coverage and ensure code reliability, improving system resilience.
- Utilized cloud services (Docker, Kubernetes, Jenkins) to automate deployment and monitoring in a CI/CD pipeline, cutting deployment time by 60% and reducing manual errors by 90%.
- Secured API communication internally and externally using Kong and Istio as gateway and service mesh tools, enhancing system security and routing efficiency by 70%.

Projects

Graduation Project : Rosheta (Blockchain-Based Healthcare Data Manager)

[Rosheta](#)

- Developed a secure platform using Hyperledger Fabric, enabling patients to manage and share their medical portfolios with healthcare providers through a decentralized blockchain solution.

Producer/Consumer Simulation

[Producer/Consumer](#)

- Simulated real-time thread coordination between producers and consumers with configurable buffer (default 10 slots). Producers and consumers run independently, contributing 50% each to buffer activity at balanced speeds.

Education

Faculty of Engineering, Alexandria University

Bachelor in Computer and System Engineering

Alexandria, Egypt

Sep 2019 – Jul 2024

- GPA:** 3.58/4.0
- Academic Courses:** Data Structures, Algorithms, Design Patterns, Probability and Statistics, Numerical Analysis, Discrete Mathematics, Linear Algebra, Operating Systems, Networks, Database, Compilers, AI, Machine Learning, Deep Learning, Computer Architecture, Distributed Systems, Security, Designing Data Intensive Applications

Awards

Dell Hacktrick Hackathon – Third Place

Dell Technologies

[Dell Hacktrick Hackathon](#)

Mar 2024

- Placed third by solving complex riddles in problem solving, computer vision, machine learning, and security
